The fixdif Package

Zhang Tingxuan

2023/03/20  Version 2.1

Abstract

The fixdif package redefines the \d command in \LaTeX and provides an interface to define commands for differential operators.

The package does well with pdf\LaTeX, \XeLaTeX and Lua\LaTeX, only works with \LaTeX format. Furthermore, this package is compatible with unicode-math package in \XeLaTeX and Lua\LaTeX.

6.6 In-document commands: \mathdif  9

https://github.com/AlphaZTX/fixdif
1 The background

It’s usually recommended that a small skip should be reserved between the differential operator and the expression before it\(^1\). Take the following line as an example:

\( f(x)dx \quad \text{and} \quad f(x)\,dx. \)

We usually consider that the example on the right side is better than the one on left side. The small skip between \( f(x) \) and \( dx \) can be regarded as a binary operator.

Some users prefer to define a macro like this:

\[
\renewcommand{d}{\mathop{\mathrm{d}}\!}\]

This macro works well in display math and text math, but still appears with the following three problems:

1. The skip before “\(d\)” still exists before the denominator in “text fraction”. This is what we do not hope to see. For example, $\d y/\d x$ produces \( d\!y/d\!x \).

2. \( \d \) is defined as a text accent command in \LaTeX\ kernel. If we defined like this, \( \d{\text{o}} \) could not produce “ọ” in text.

3. The skip before “\(d\)” should behave like skips around a binary operator. It should disappear in script math and script script math. For example, $a+b$ yields \( a+b \) while $^{(a+b)}$ yields \( a^{+b} \), the skips around “+” disappear in superscript. But in the definition above, $^{(f(x)\,d\,x)}$ yields \( f(x)\,dx \) but not \( f(x)\,d\,x \).

To solve these problems, you can try this package.

2 Introduction

To load this package, write

\[
\text{\texttt{usepackage\{fixdif\}}}
\]

in the preamble. fixdif allows you to write this line anywhere in the preamble since version 2.0. In your document,

\[
\text{\texttt{\[ f(x)\,d\,x, \quad \frac{\d y}{\d x}, \quad \d y/\d x, \quad a^{\d x}. \]}}
\]

will produce

\( f(x)\,dx, \quad \frac{dy}{dx}, \quad dy/dx, \quad a^{dx}. \)
2.1 Basic commands and package options

The fixdif package provides a \d command for the differential operator “d” in math mode. When in text, \d behaves just like the old \d command in \LaTeX or plain \TeX as an accent command. For example,

\$\d x\$ and \d x

yields “dx and \(x\)”.

Set the font of \d There are two package options to control the style of \d in math mode — \texttt{rm} and \texttt{normal}. The default option is \texttt{rm}, in which case $f(x)\d x$ produces \(f(x)\,dx\). If you chose the \texttt{normal} option, that is

\usepackage[normal]{fixdif}

$f(x)\d x$ yields \(f(x)\,d\!x\).

\resetdfont Regardless of the two options above, you can reset the font of \d through \resetdfont command in preamble:

\resetdfont{\mathsf}

then $\d x$ yields \(d\!x\). Notice that the argument of \resetdfont should be a command with one argument.

\partial Control the behavior of \partial In default, \partial will be regarded as a differential operator after you load fixdif. If you don’t like this default setting, you can use the \texttt{nopartial} option:

\usepackage[nopartial]{fixdif}

If you choose to use the default settings, \partial yields the ordinary symbol “∂”.

3 Define commands for differential operators

Attention! The commands in this section can be used in preamble only!

3.1 Define commands with a single command name

\letdf \letdf{⟨cmd⟩}{⟨csname⟩} (preamble only)

The \letdf command takes two arguments — the first is the newly-defined command and the second is the control sequence \textit{name} of a math character, that is, a command without its backslash. For example,

\textsuperscript{1}See https://tex.stackexchange.com/questions/14821/whats-the-proper-way-to-typeset-a-differential-operator.
Then \texttt{\textbackslash delta} itself will be a differential operator.

The second argument \texttt{\textbackslash csname} of \texttt{\textbackslash letdif} command can be used repeatedly. If you want to get the ordinary symbol of \texttt{\textbackslash csname}, you can input \texttt{\textbackslash partialnondif} \texttt{\textbackslash csname\textbackslash nondif} in math mode. For example, in default, \texttt{\textbackslash partialnondif} yields the old partial symbol “∂”.

\texttt{\textbackslash letdif*\{\textbackslash cmd\}\{\textbackslash csname\}}
\hspace*{1cm} (preamble only)

This command is basically the same as \texttt{\textbackslash letdif}, but this command will patch a correction after the differential operator. This is very useful when a math font is setted through \texttt{\textbackslash unicode-math} package. For example,

\begin{verbatim}
\usepackage{unicode-math}
\setmathfont{TeX Gyre Termes Math}
\usepackage{fixdif}
\letdif{\vr}{updelta}
\end{verbatim}

this will cause bad negative skip after \texttt{\vr}, but if you change the last line into

\texttt{\letdif*{\vr}{updelta}}

you will get the result correct.

\subsection{Define commands with multi commands or a string}

\texttt{\newdif\{\textbackslash cmd\}\{\textbackslash multi-cmd\}}
\hspace*{1cm} (without correction, preamble only)

\texttt{\newdif*\{\textbackslash cmd\}\{\textbackslash multi-cmd\}}
\hspace*{1cm} (with correction, preamble only)

The first argument of these commands is the newly-defined command; and the second argument should contain \texttt{\textbackslash multi-cmd} tokens. For example, if you have loaded the \texttt{\textbackslash xcolor} package, you can use the following line:

\begin{verbatim}
\newdif{\redsfd}{\textsf{\textcolor{red}{d}}}
\end{verbatim}

Then you get the \texttt{\redsfd} as a differential operator. Take another example,

\begin{verbatim}
\newdif{\texttt{D}}{\texttt{\textbackslash \texttt{\texttt{\texttt{\texttt{\texttt{\texttt{mathrm}}}}}}}}
\end{verbatim}
Then you get $\Delta$ for an uppercase upright “D” as a differential operator.

If your second argument contains only one command like $\Delta$, it’s recommended to use $\texttt{\letdif}$ or $\texttt{\letdif*}$ instead.

$\texttt{\newdif}$ and $\texttt{\newdif*}$ will check whether $\langle \texttt{cmd} \rangle$ has been defined already. If so, an error message will be given.

$\texttt{\renewdif}$ and $\texttt{\renewdif*}$ will check whether $\langle \texttt{cmd} \rangle$ has not been defined yet. If so, an error message will be given.

### 4 Using differential operators temporarily

$\texttt{\mathdif}$

These two commands can be used in math mode only, more specifically, after $\texttt{\begin{document}}$. For example, $x \mathdif \Delta \psi$ will get $x \Delta \psi$.

### 5 Examples

This section shows how to use this package properly in your document.

Take the two examples below:

```
\letdif{\Delta}{\Delta} % Example 1, in preamble
\letdif{\nabla}{\nabla} % Example 2, in preamble
```

Actually, the second example is more reasonable. Sometimes, we take “$\Delta$” as laplacian (equivalent to $\nabla^2$), while “$\Delta$” can also be regarded as a variable or function at some other times. Consequently, it’s better to save a different command for “$\Delta$” as laplacian while reserve $\Delta$ as a command for an ordinary math symbol “$\Delta$”. However, in the vast majority of cases, “$\nabla$” is regarded as nabla operator so there is no need to save a different command for “$\nabla$”. Then we can correct the code above:

```
\letdif{\laplacian}{\Delta} % Example 1, corrected, in preamble
```

With the $\texttt{xparse}$ package, we can define the command in another method:

```
\Let{\nabla}{\nabla}
\DeclareDocumentCommand{ \laplacian }{ s }{
  \IfBooleanTF{#1}{\mathdif{\Delta}}{\nabla^{2}}
}
```

Then $\laplacian$ produces $\nabla^2$ and $\laplacian*$ produces $\Delta$. 5
Dealing with “+” and “−” If you input \$-\d x\$, you’ll get “− dx” in your document. However, if you think “−dx” is better, you can input \(-\d x\). The “\d x” in a group will be regarded ordinary but not inner so that the small skip will disappear. Maybe “− dx” is just okay.

6 The source code

Dealing with “+” and “−” If you input \$-\d x\$, you’ll get “− dx” in your document. However, if you think “−dx” is better, you can input \(-\d x\). The “\d x” in a group will be regarded ordinary but not inner so that the small skip will disappear. Maybe “− dx” is just okay.

6 The source code

Check the \TeX\ format and provides the package name.

\NeedsTeXFormat{LaTeX2e}
\ProvidesPackage{fixdif}[2023/03/20 Interface for defining differential operators.]

6.1 Control the skip between slashes and differential operator

Change the math code of slash (/) and backslash (\) so that the skip between slashes and differential operators can be ignored.

If the unicode-math package was loaded, use the X\TeX/Lua\TeX\ primitive \texttt{\textbackslash Umathcode} to change the type of slashes. The numeral “4” stands for “open”. If unicode-math was not loaded but fontspec loaded, check if fontspec had reset math fonts, that is to say, the \texttt{no-math} option.

\AtBeginDocument{%
\ifcsname symbf\endcsname%
\csname bool_if:cF\endcsname{g__um_main_font_defined_bool}%
\def\fd@patchUmathcode#1{%
\@tempcnta=\numexpr(\the\Umathcodenum#1-#1)/16777216\relax
\Umathcode #1 = "4 \@tempcnta #1}%
\fd@patchUmathcode{"2F}%
\fd@patchUmathcode{"5C}%
\else\ifcsname fontspec\endcsname
\csname bool_if:cT\endcsname{g__fontspec_math_bool}%
{\everymath{\mathcode`/="413D\relax}%
\PackageWarning{fixdif}{Requires `no-math' option of fontspec!\MessageBreak}%
\texttt{\textbackslash Umathcode} only influences "/"%
\fi\fi%
\fi\fi%
\}

Use \texttt{\textbackslash Umathcode} to change the type of slashes. The \texttt{\textbackslash backslash} needs to be redefined through \texttt{\textbackslash delimiter} too.

\texttt{\textbackslash delimiter}="413D
\texttt{\textbackslash delimiter}="426E% \texttt{\textbackslash backslash}
\protected\def\backslash{\delimiter"426E30F\relax}

6.2 Patch the skips around the differential operator

The following \texttt{\textbackslash fixmu@p} patches the skip after the differential operator.

\def\fixmu@p{\mathchoice{\mskip\thinmuskip}{\mskip\thinmuskip}{\mskip\thinmuskip}{}{}}

6
The \texttt{s@fdmu@p} patches the commands with star (\texttt{\letdif*}, etc).

24 \texttt{\def \s@fd@mu@p{\mathchoice{}{}{\hbox{}}{\hbox{}}}}

\section*{6.3 Declare the package options}

25 \texttt{\DeclareOption{rm}{}}% \AtBeginDocument{\ifcsname symbf\endcsname\gdef\@fd@dif{\symrm{d}}\fi}\
26 \texttt{\gdef\@fd@dif{\mathrm{d}}}}

30 \texttt{\ExecuteOptions{rm,partial}}

33 \texttt{\ProcessOptions\relax}

35 \texttt{\AtEndOfPackage{\letdif{\partial}{partial}}}

37 \texttt{\gdef\resetdfont#1{\AtBeginDocument{\let\@fd@dif\relax\gdef\@fd@dif{#1{d}}}}}

\section*{6.4 Deal with the \texttt{\d} command}

\texttt{\fd@dif} \texttt{\fd@dif} is the differential operator produced by \texttt{\d} in math mode. Here we prefer \texttt{\mathinner} to \texttt{\mathbin} to make the skip.

38 \texttt{\def \fd@dif{\mathinner{\@fd@dif}\fd@mu@p}}

\texttt{\fd@d@acc} Restore the \texttt{\d} command in text by \texttt{\fd@d@acc} with \texttt{\let}.

39 \texttt{\AtBeginDocument{\let \fd@d@acc \d}}

40 \texttt{\DeclareRobustCommand\d{\ifmmode \fd@dif\else \expandafter\fd@d@acc \fi}}

\section*{6.5 User’s interface for defining new differential operators}

\texttt{\letdif} Define the \texttt{\letdif} command. The internal version of \texttt{\letdif} is \texttt{@letdif} and \texttt{s@letdif}.

\begin{verbatim}
    #1 is the final command; #2 is the “control sequence name” of #1’s initial definition. Here we create a command (\texttt{\csname#2nonfif\endcsname}) to restore #2.

41 \texttt{\def @} \letdif#1#2{\AtBeginDocument{\ifcsname #2nondif\endcsname\expandafter\let\csname #2nondif\expandafter\endcsname\csname #2\endcsname\fi\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandafter\expandaft
The definition of \s@letdif is similar, but with the patch for negative skips.

\def\s@letdif#1#2{\AtBeginDocument{%
  \ifcsname #2nondif\endcsname\else%
  \expandafter\let\csname #2nondif\expandafter\endcsname \csname #2\endcsname%
  \fi%
  \DeclareRobustCommand#1{\mathinner{\s@fd@mu@p\csname #2nondif\endcsname\hbox{}}\fd@mu@p}%
}\}
\DeclareRobustCommand\letdif{\@ifstar\s@letdif\@letdif}
\@onlypreamble\letdif

\newdif Define the \newdif command. #1 is the final command; #2 is the “long” argument.

\long\def\@newdif#1#2{\AtBeginDocument{%
  \ifndef\string#1\else
  \PackageError{fixdif}{\string#1 is already defined}{Try another command instead of \string#1.}%
  \fi%
} \long\def\s@newdif#1#2{\AtBeginDocument{%
  \ifndef\string#1\else
  \PackageError{fixdif}{\string#1 is already defined}{Try another command instead of \string#1.}%
  \fi%
}}\DeclareRobustCommand\newdif{\@ifstar\s@newdif\@newdif}
\@onlypreamble\newdif

\renewdif Define the \renewdif command.

\long\def\@renewdif#1#2{\AtBeginDocument{%
  \ifndef\string#1\else
  \PackageError{fixdif}{\string#1 has not been defined yet}{You should use \string\newdif instead of \string\renewdif.}%
  \fi%
} \long\def\s@renewdif#1#2{\AtBeginDocument{%
  \ifndef\string#1\else
  \PackageError{fixdif}{\string#1 has not been defined yet}{You should use \string\newdif instead of \string\renewdif.}%
  \fi%
}}\DeclareRobustCommand\renewdif{\@ifstar\s@renewdif\@renewdif}
\@onlypreamble\renewdif
6.6 In-document commands: \mathdif

\def\@mathdif#1{\mathinner{#1}\fd@mu@p}
\def\s@mathdif#1{\s@fd@mu@p\mathinner{#1\mbox{}}}\fd@mu@p
\DeclareRobustCommand\mathdif{\@ifstar\s@mathdif\@mathdif}

End of the package.

(/package)
